A PITCH FOR JUPITER

From an app for money to an operating system for money

Two product ideas: how Jupiter earns trust when things break, and how it becomes the system customers let run their money.

Prepared by Sriram A

Product Manager

Jupiter has already earned the hardest part

The “one app for money” vision is real banking, spends, saving and investing already live under one roof.

Banking & UPI

Everyday spending, payments and account management

Pots

Goal-based saving, split across purposes

Investments

Mutual funds, FDs/RDs, Magic Spends automation

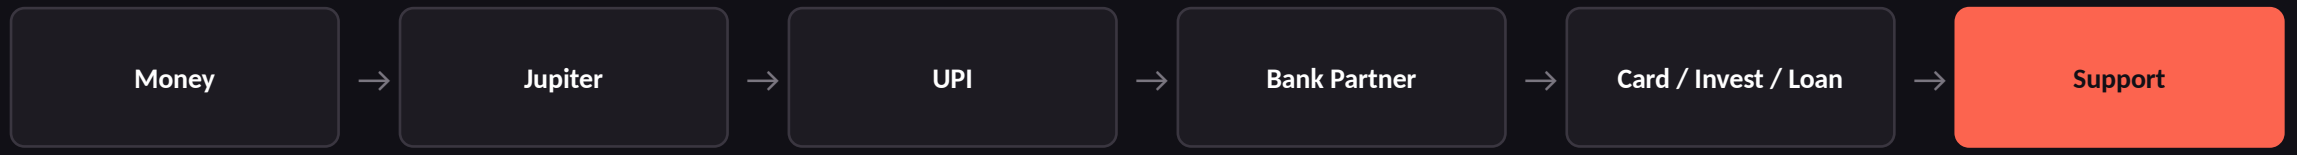

Credit

Loans and credit products, built in

The signal from recent customer feedback: the gap isn’t features. When something breaks KYC, account opening, Pots, a payment the resolution journey can feel fragmented across bots, tickets and channels.

An “all-in-one” product isn’t yet an “all-in-one resolution” experience

The customer’s money moves through several systems the customer doesn’t see and doesn’t care about:

WHAT THE CUSTOMER ACTUALLY SAYS

“My money isn’t working. Fix it.”

Why it’s costly: if a streaming app breaks, you’re annoyed. If your banking app breaks and money is stuck, the reaction is fear — trust is the actual product.

So this isn’t a support problem. It’s a product problem and it’s the opening for Idea 1.

IDEA 1

Jupiter Resolve

A single, transparent resolution layer for every failed or stuck financial event — regardless of which partner or product caused it.

From “contact support” to “we’ll tell you what happened, and when it’s fixed.”

WHAT THE CUSTOMER SEES

UPI PAYMENT — STATUS UPDATE

Failed

₹2,500 to Swiggy

WHAT HAPPENED	Your bank partner declined the transaction.
YOUR MONEY	₹2,500 is safe not lost.
NEXT STEP	We’re processing the automatic reversal.
EXPECTED RESOLUTION	Today, by 8:30 PM — we’ll notify you.

Why this works: the system already knows the account, transaction, partner and history — so resolution starts with context, not “please explain your issue.”

Product impact: every unresolved issue is a potential churn event. Turning “something went wrong” into “something went wrong, and Jupiter handled it transparently” is a durable trust advantage.

IDEA 2

Money Autopilot

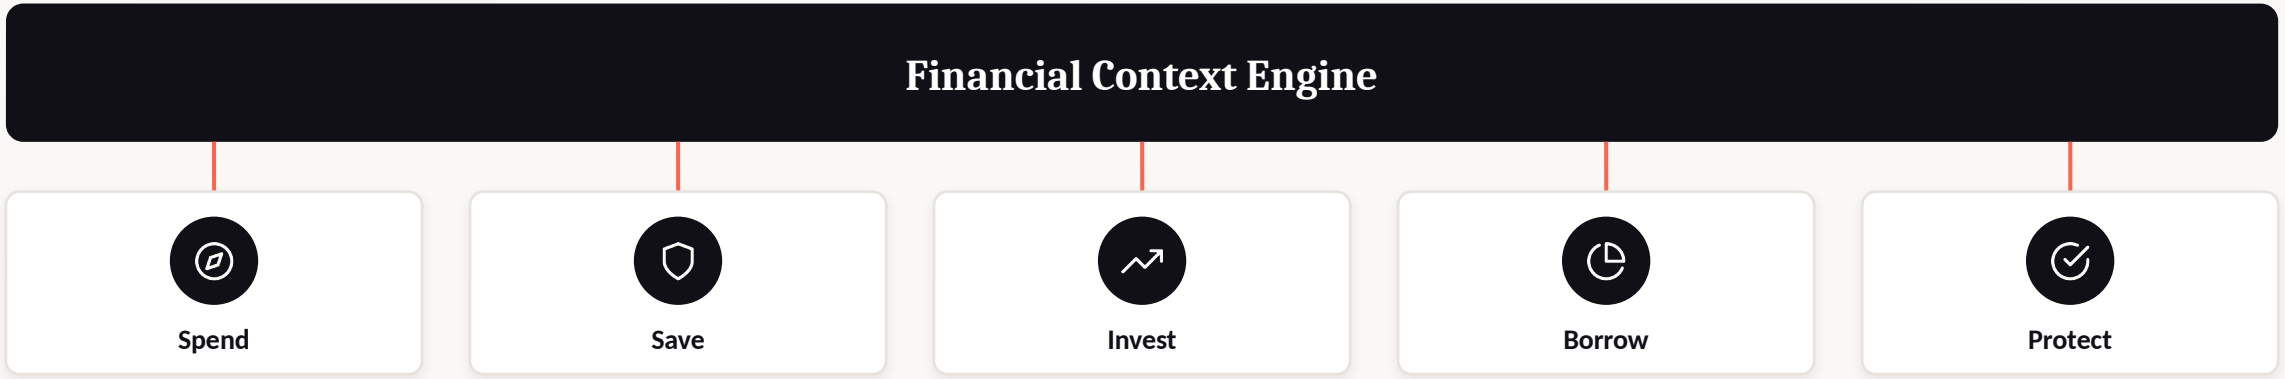

Jupiter already owns every building block of a customer's financial life. The missing piece isn't a new product it's an intelligence layer that connects the ones that already exist.

TODAY

Banking | Spending | Pots | Investments | Loans

Separate products the customer has to operate, one at a time.

WITH MONEY AUTOPILOT

Not "here are all our financial products." Instead: "here's what you should do with your money."

Money Autopilot, in the moments that matter

On payday

₹1,00,000 received Jupiter reads context, not just the balance:

Expenses & rent	**₹40,000**
Credit card due	**₹10,000**
Emergency fund	**₹20,000**
SIPs	**₹10,000**
Unallocated	**₹20,000**

Suggested: ₹10,000 → Emergency Fund, ₹5,000 → Europe Trip goal, ₹5,000 kept available.

Customer stays in control — [Do it] [Change]

Before you spend

Not a restriction a contextual decision layer, right before checkout.

"You can afford this ₹30,000 spent, and your rent, savings and goal contributions this month are still on track. Go ahead."

"This purchase is likely to affect your rent goal you'd be ₹7,500 short by month-end. Move ₹7,500 from your Travel Pot?" [Yes] [No]

It doesn't say "don't spend." It says "spend with context" — which fits Jupiter's brand.

THE COMMON THREAD

Jupiter’s next advantage doesn’t need another financial product.

It needs the products it already has to feel like one intelligent financial system.

Jupiter Resolve

Fixes the moment trust is won or lost when something goes wrong.

Money Autopilot

Builds the moat an intelligence layer only Jupiter’s data can power.

Together

Reliable in failure, proactive in daily use the full “operating system” promise.

This is closer to the original promise: banking, lending and investing as one coherent, honest experience — not features sold, but money simplified.

Let’s build this

I’d love to go deeper on either idea, user flows, a phased rollout, or how I’d measure impact (resolution TAT, churn on failed transactions, autopilot adoption).

Thank you for reading this far and for building something that treats money as a thing to be simplified, not sold.
